Abstract

A performance review has been undertaken for flood protection assets on the Lower Waikato River main channel. The assessment scope is outlined in the project management plan (Doc# [15799033](#)). The scope covers collation and review of previous literature and models, updating the models with most recent hydrology, cross-section and stopbank survey data, and incorporating specific flood assets within the system to improve model outputs and flood protection stopbanks performance.

The stopbank performance is a measure of the vulnerability of a stopbank to overtopping under a design event. The assessment process involves comparing actual crest levels of a stopbank against the corresponding design flood level to establish a performance grade for a 100 m length of the stopbank. Performance grades define the percentage of freeboard left compared to design freeboard, which informs the need and timing for stopbank upgrades.

The review also involves modelling future climate change hydrology and design flood profiles to inform stakeholders of the potential increase in flood risks resulting from future climate. In addition, it informs the Council of the potential loss in flood protection service level to assist in management decisions to build community resilience against future flooding.

Executive summary

The Lower Waikato-Waipa Control Scheme (LWWCS) is a comprehensive river control scheme designed to provide flood protection and drainage improvements within the flood plains of the lower Waikato and Waipa rivers. The flood magnitude against which the stopbanks were designed (Protection Standard) varied along the floodplain due to the technical and economic feasibility considerations. In general, the protection standard provided by stopbanks along the Main River Channel included a 1%, 2% or 10% Annual Exceedance Probability (AEP) river flood event or a 1% AEP tidal event. Note that other protection standards were adopted along tributaries.

The Flood Protection Performance Review (FPPR) focuses on Stopbank and Spillway assets of the LWWCS along the Lower Waikato River Main Channel only and excludes the Mangawara, Whangamarino, Lake Waikare and Mangatawhiri flood protection schemes. The flood protection assets along the Lower Waikato Main channel consist of 123.5 km of stopbanks and 1.6 km of spillways.

Flood protection schemes managed by Waikato Regional Council (WRC) are reviewed generally every ten years as provided for in the Regional Asset Management Plan (Doc# [12705650](#)). The purpose of the review is to investigate the impacts on design flood levels due to changes in natural and physical factors such as:

1. Rainfall
2. Tide levels
3. Catchment development and land use
4. River channel and floodway parameters/dimensions

The performance of a flood defence (stopbank) against overtopping is measured by comparing its actual surveyed (stopbank/spillway) crest levels with the Design Crest Level. The Design Crest Level is determined by a Design Flood Level plus a design freeboard. The Level of Service for an asset is the frequency of the Design Flood Level, expressed as an Annual Exceedance Probability (AEP) or Average Return Interval (ARI).

The performance of an asset is classified by a grade between 1 and 5. An asset performance grade of 1 or 2 means the agreed Level of Service is met. A performance grade of 5 or 4 means the agreed Level of Service is not met or marginally met, requiring an upgrade to their design levels in the immediate term within 1 to 5 years. Performance grade 3 stopbanks means the Level of Service is met, but stopbanks are likely to deteriorate further, and planned upgrade will be required in the medium term of 5-to-10-year period.

Performance Assessment:

	Summary of stopbank and spillway performance						Total
Performance grade	1	2	3	4	5	Not assessed	
Total length (m)	79,424	22,977	6,936	3,946	6,609	3,268	123,160
Percentage (%)	64.5%	18.7%	5.6%	3.2%	5.4%	2.7%	100.0%

1. Approximately 113.3km (92.0%) of the 123.2km total stopbank length are above the Design Flood Level (DFL) and can withstand a design event without overtopping.
2. 10.6km of stopbanks with performance grades 4 and 5 are below the performance standard. These stopbanks must be raised by approximately 0.38m on average to meet the design crest level (DCL).

3. The Morrison Road return (left and right bank) have not been reviewed as the stopbank was not constructed to meet any specific design event standard. A separate review of the level of service and management options is planned.
4. Approximately 76.6% (1.204km) of the 1.6 km spillway total length is classified as grade 1 to 4. Approximately 12.1% (190 m) of total spillway length is the Morrison Road return (left bank) Spillway, which has not been assessed.
5. For some stopbank/spillway sections, the performance assessment at the start and end may differ from what is onsite (due to projected coordinate survey errors). The coordinates of the first and last link of a stopbank or spillway section should be verified onsite before any asset upgrade is carried out.

Climate Change Assessment:

1. The estimated average water level rise for the 10-year ARI with climate change RCP scenarios for the Lower Waikato River main channel is 0.49m.
2. The estimated average water level rise for the 100-year ARI with climate change RCP scenarios for the Lower Waikato River main channel is 0.44m.
3. The Lower Waikato River main channel Scheme minimum freeboard of 0.3 is less than this maximum average water level rises due to climate change.
4. To accommodate Climate change and retain the current LOS with appropriate freeboard, the DCL's will need to increase.

Recommendations:

1. The identified design flood levels and crest levels for each major stopbank and spillway (to address the measured change since the last scheme review) are adopted.
2. The design standard is formalised as follows:
 - a. For the 123.2km of stopbanks designed to withstand river flooding, it is recommended that the existing 2, 10 and 100-year ARI design standards be retained.
3. Stopbank upgrades for the 10.6 km that are at a performance grade of 4 or 5
4. Prioritisation of stopbank upgrades to be undertaken by the Lower Waikato Zone, Asset Management and Engineering Delivery Teams.
5. Rangiriri Spillway performance will be reassessed with the performance assessment of the Whangamarino system scheduled to start in the 21/22 financial year.
6. Further works are required on the accuracy of surveyed information and asset location prior to carrying out upgrade works.
7. Based on the Climate Change impact information provided for the Lower Waikato River main channel, much of the existing stopbanks and spillways will require future upgrades to maintain the current Level of Service. Further planning and consideration of options are recommended to address future flood protection requirements.

1 Introduction

1.1 Overview

Waikato Regional Council Integrated Catchment Management (ICM) Directorate provides catchment management, river management, flood protection, and land drainage services across the region. The standards and levels of service provided are established in agreement with the regional communities. Consequently, Flood protection schemes generally involve stopbanks with drainage outlets along river systems forming contained floodways to convey flood flows downstream, preventing flooding of adjacent properties. The assets, levels of service and management requirements are documented in the Regional Asset Management Plan (Doc #[12705650](#)).

Flood protection schemes managed by WRC are reviewed regularly. The purpose of the review is to investigate the effects of changes in both natural and artificial factors on the Lower Waikato River hydraulics and scheme design flood levels, such as:

1. Rainfall
2. Tide levels
3. Catchment development and land use
4. River channel and floodway parameters/dimensions

These levels form the basis for assessing stopbank performance, and thus the scheme's ability to meet its currently agreed level of service.

1.2 Design performance measures

The levels of service that were initially established for the Lower Waikato Waipa Control Scheme (LWWCS) were set out in the 1959 scheme design report (WVA1959 – refer to doc#[2261063](#)). The current design service levels were confirmed through an extensive consultation process undertaken in 1997 when the first asset management plan was developed largely unchanged from the original scheme design. The stopbank design standards/service levels, expressed in terms of Annual Exceedance Probability (AEP) and freeboard, are shown in Table 3.1.

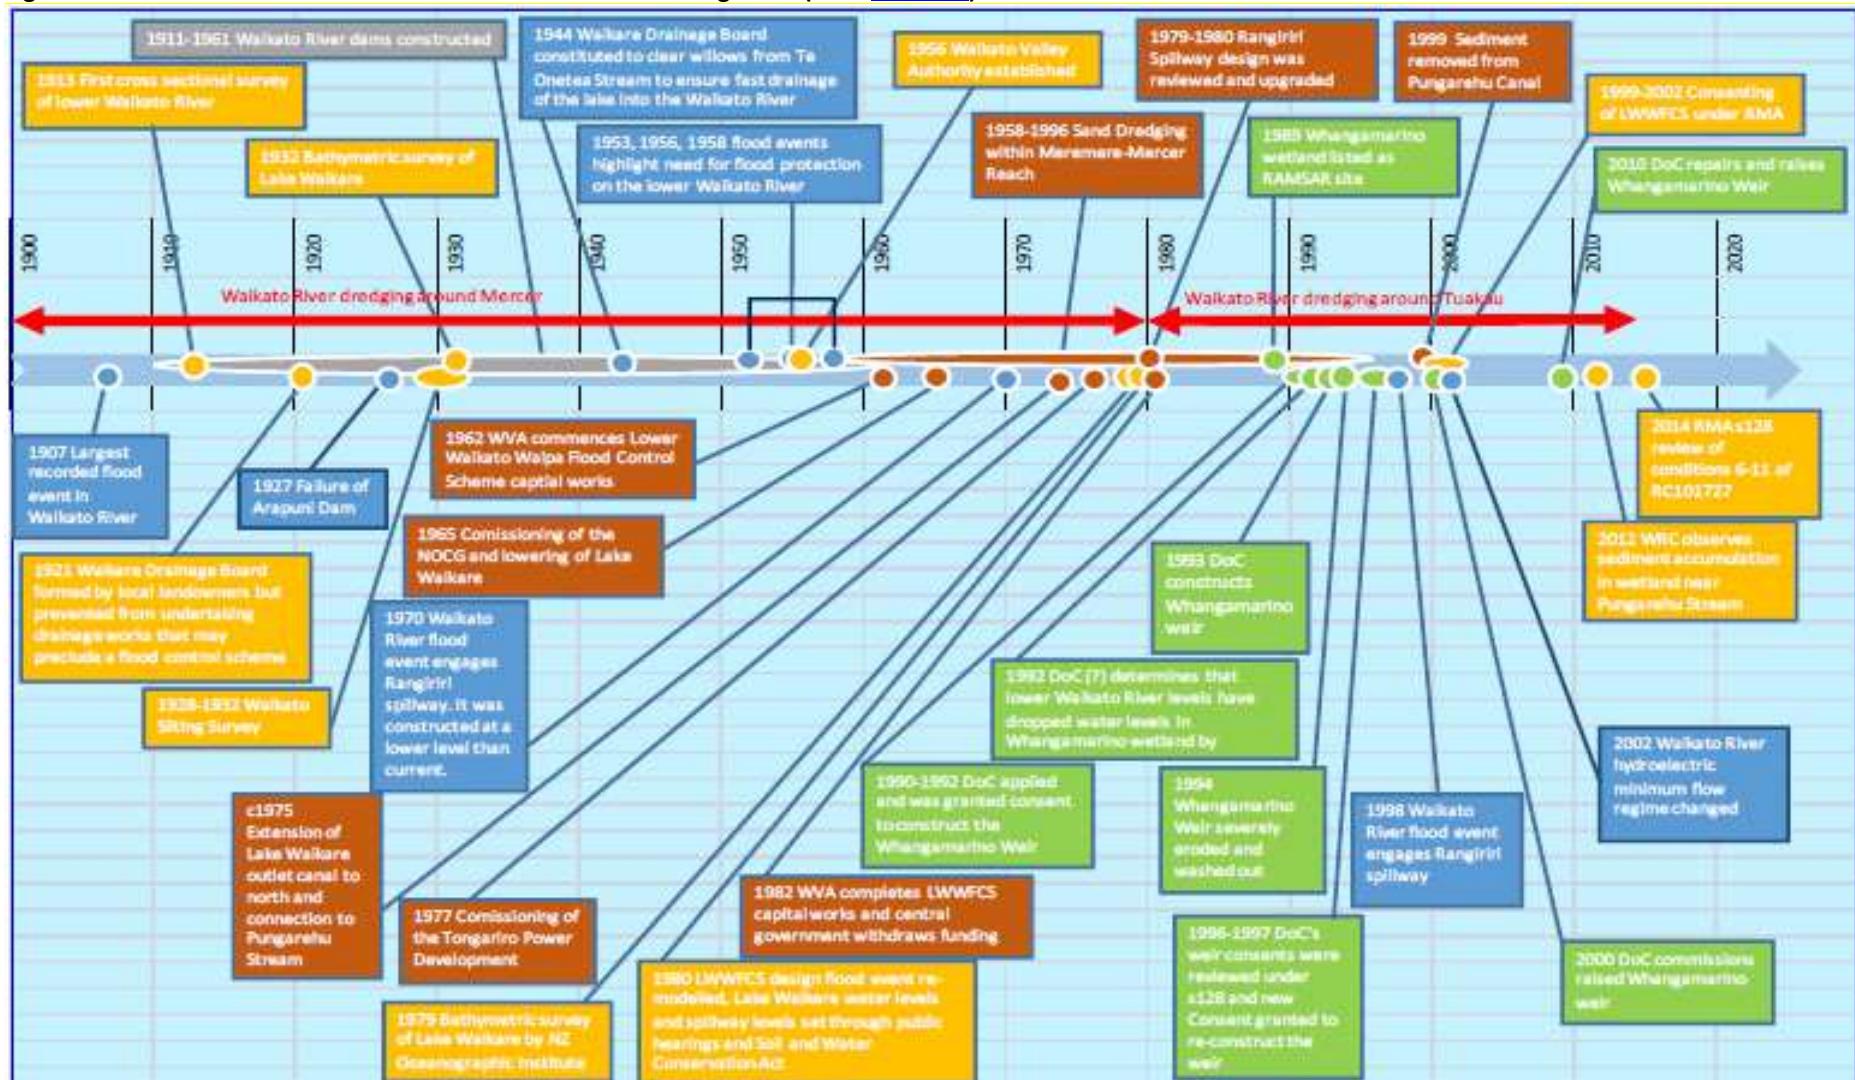

1.3 Overview of the Lower Waikato River Catchment

The Lower Waikato River Catchment (~2900 km²) comprises the Waikato River catchment area from Ngāruawāhia to the Tasman Sea and covers approximately 20 per cent of the total Waikato River catchment area. The LWWCS was established after the 1958 flood to reduce the losses caused by widespread flooding.

Prior to the LWWCS establishment, historical flooding data were gathered for the Waikato River Valley from 1907 to 1958. The earliest sounding data on record for Waikato River from the River Head to the Elbow was done in 1862 by Captain Greaves. A summary of the Lower Waikato Flood Protection Scheme Historical Background is shown in Figure 1**Error! Reference source not found.** below.

Hydraulic assessments of the performance of the main channel of the Lower Waikato River were undertaken in 1959, 1983, 2009 and 2013 (refer to doc #[2261063](#), # [3300786](#), #[1561932](#) and #[2483094](#), respectively for these assessment reports).

Figure 1 Lower Waikato Flood Protection Scheme Historical Background (doc# 11655555)

1.4 Objectives of the Lower Waikato Flood Protection Review

The objectives of this review are:

1. To collate stopbank crest level survey information for all stopbanks along the Lower Waikato River Main Channel.
2. To overlay the stopbank crest level profile for each stopbank over the design event profile for that stopbank.
3. Determine the freeboard height between the two profiles above and assess the freeboard height against the design freeboard height to establish the Performance Grade of the stopbank at 100 m intervals.
4. Prepare a report outlining the results of the performance assessment for each river stopbank, with an overall map showing the different performance grades. Note: asset management requirement is that report includes a practical interpretation of the data. i.e., 1% AEP- =220m³/s at Tuakau = 3m stopbank height.
5. Spreadsheet for Conquest/Infor is quality checked before being submitted to Asset Management for input into Conquest/Infor.

2 Levels of service

Levels of service define the quality of delivery for a particular activity or service against which service performance can be measured. Associated with each service level are one or more performance measures that enable measurement of service level performance. The Regional Asset Management Plan (RAMP) states the service level for flood protection is:

“To provide the regional community with an agreed level of protection from floods”.

The expected outcome from a service level agreement and flood protection performance review is that; Communities are less vulnerable and more resilient to flooding, the effects of climate change and changes to society and the economy.

Level of Service is expressed as the Average Recurrence Interval (ARI) or Annual Exceedance Probability (AEP) of the design event. Design Flood Levels for stopbanks are then calculated from the Design Flood Standard. Design Freeboard provides a safety allowance (over and above the Design Flood Level) when constructing and maintaining stopbanks.

The RAMP performance measures and targets are shown in Table 2 below.

Table 1: Assets Levels of Service, Performance Measures and Targets

Alignment	Requirement	Measure
Flood Protection		
System Adequacy	Control effect of a flood event (area affected)	System designed to agreed annual exceedance probability levels
System Maintenance	Flood Protection and control assets maintained, repaired, and renewed	85% of planned maintenance actions achieved each year
		93% of Rural and 95% of Urban Stopbanks maintained to above-designed flood height, or as agreed within each zone

Alignment	Requirement	Measure
		Flood recovery plans put in place for all major ¹ events setting out time frames under which flood response actions are to be completed
River Management		
System Maintenance	Proactive monitoring and maintenance of priority rivers and streams	85% of planned maintenance actions achieved each year
		95% of enquiries being responded to within two working days
		Recovery plans put in place for all major events setting out time frames under which flood response actions are to be completed
Land Drainage		
System Adequacy	Reliable water table levels to ensure pastoral growth	Surface water ponding in a 24 Hour, 10%AEP rainfall event is removed within a 3-day period.
	Control effect of rain events	System designed to handle events with up to a 10% annual exceedance probability
System Maintenance	Land drainage assets maintained, repaired, and renewed	% of planned maintenance achieved each year, as agreed within each scheme.

In 2015 the following strategy for the renewal of stopbanks was adopted as stated in the RAMP:

- Stopbanks with performance grades 4 and 5 will be programmed for renewal.
- All stopbanks with performance grades 4 and 5 will be renewed within 5 years of being identified.
- When the renewal backlog is complete, expenditure on stopbank renewal will match depreciation.

All stopbanks with performance grade 4 can withstand a design event without overtopping. However, stopbank settlement over time can change some performance grade 4 to performance grade 5 stopbank, hence the need to renew both performance grades.

3 Flood protection assets and service levels

The table below is a summary of all the stopbank assets that have been investigated in this performance assessment review.

Table 2: Summary of current performance measures

*Design standard is unspecified, but the reduced levels are as per the original design

Note 1: Morrison Road return left and right stopbanks do not have a specified design standard

Note 2: Tickles stopbank service levels & management is under review with the property owner.

Aka Aka Otau Buffer Stopbank

The original function of the Buffer stopbank is to isolate the river flooding from Tidal fluctuation along Holmes Canal. The design attempted to ensure that Aka Aka flood-gated drainage outlets operate (e.g. open and close) in response to the tidal cycle, which provides longer periods of operation during low tide.

This bank became a silt pile for the river and canal dredging, so its height and construction methods have not been actively managed over its life.

The original design height of the stopbank was RL 2.56 m (MVD) at its downstream end near Hoods Landing and RL 2.61 m (MVD) at the upstream end of the stopbank (doc#[2225153](#)). Frequency Analysis of Hoods Landing Tide Gauge suggests that the 2.33-year ARI tidal event is at RL 2.35 m MVD (refer to Table 3). Therefore, for this modelling, a freeboard of approximately 210mm to 260mm has been applied for this stopbank. For the performance assessment, a freeboard of 200 mm was used.

Table 3: Waikato at Hoods Landing

Return period	Gauge Level (metres)	Moturiki Datum (metres)
2.33	2.27	2.35
5	2.34	2.43
10	2.40	2.49
20	2.46	2.55
30	2.49	2.58
50	2.54	2.62
100	2.59	2.68

Based on these parameters, the performance assessment shows most of the stopbank is grade 4 or 5, well below the used design crest level and design flood level. It is recommended that an assessment of the required design crest level is completed before any upgrades are undertaken.

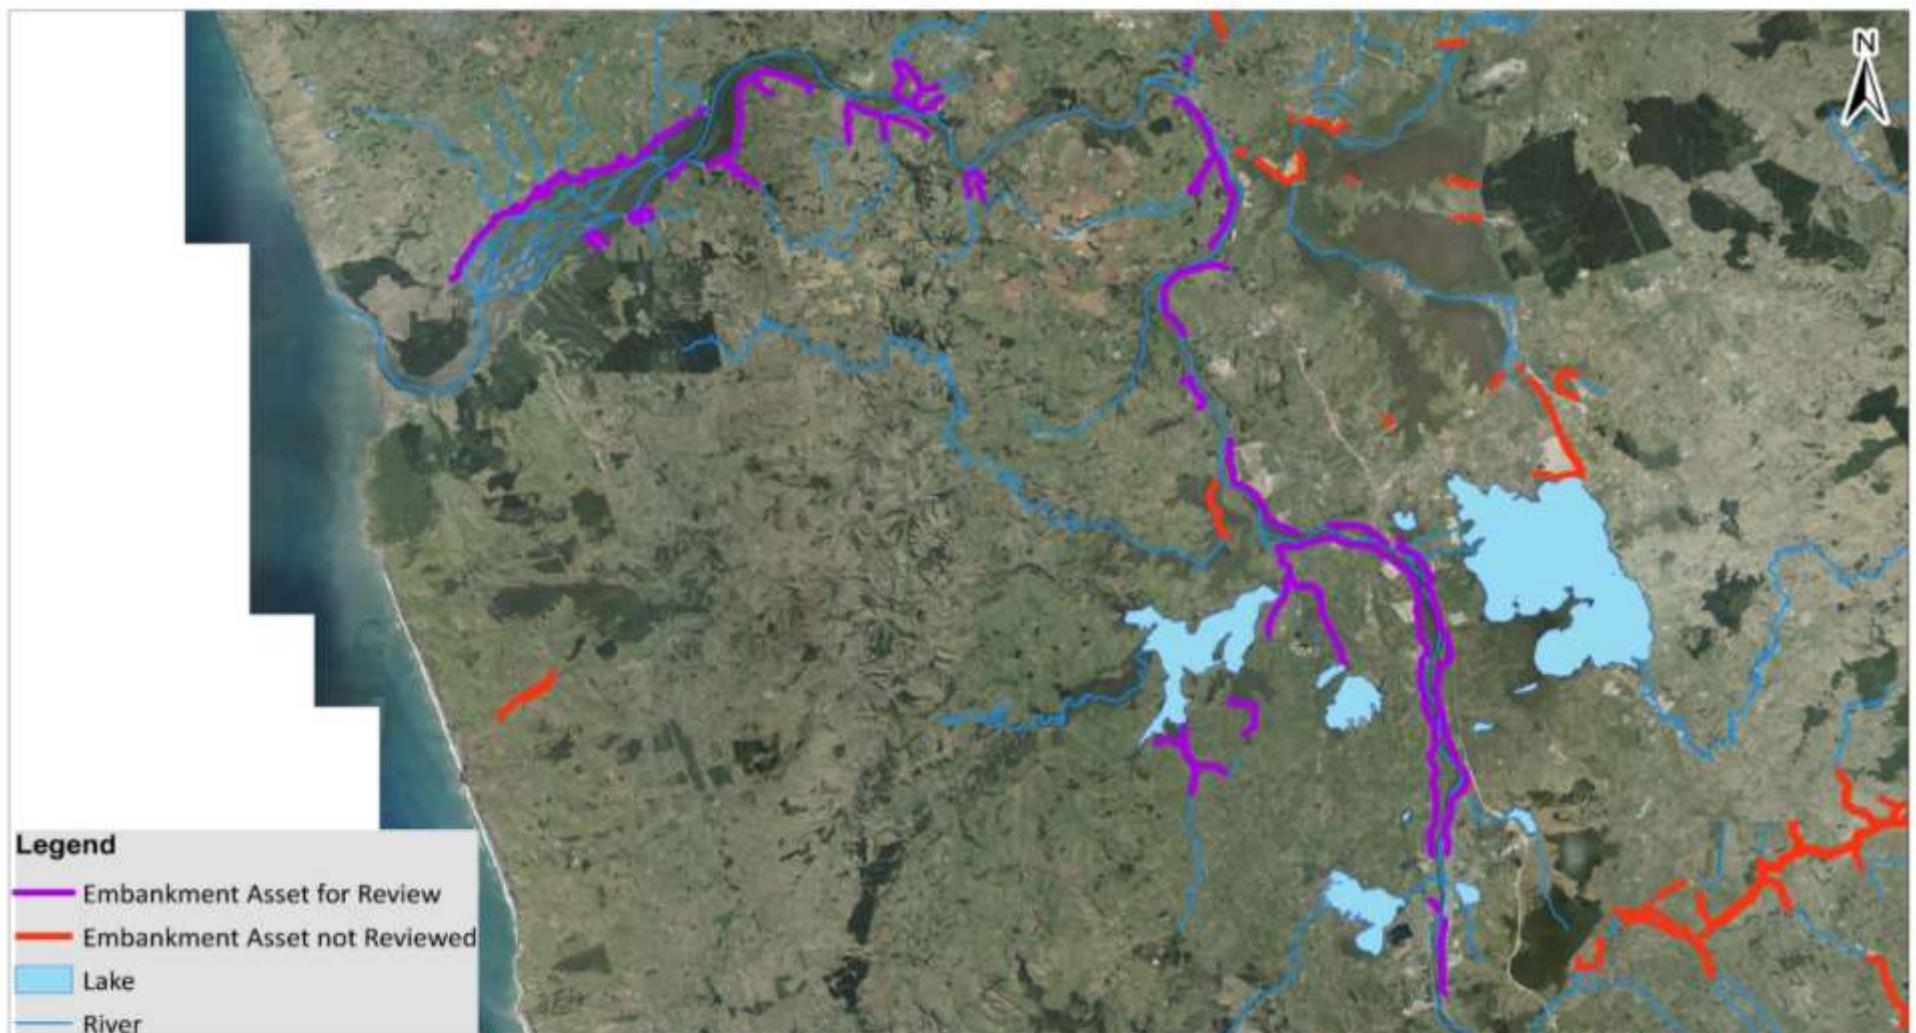

Morrison Road Return Stopbank

The Morrison Road Return stopbank was not constructed to meet any specific design event standard. The stopbank is typically overtopped several times annually and has settled significantly as the underlying soils are organic peat layers. A review of the overall performance and management options has been initiated, and accordingly, no performance assessment is carried out for these stopbanks.

Rotongaro Canal RB Austins Section Spillway

The Rotongaro Canal RB Austins Section spillway is constructed on an internal stopbank (Rotongaro Canal Right Stopbank). The performance is measured against its original design height (doc#[15181478](#)) and does not relate to rainfall/flood events. Refer to doc#[1534866](#)) for details of the Rotongaro as-built cross-section.

4 Model Result

The Lower Waikato River Catchment has been modelled by DHI(NZ) using their Mike11 hydraulic modelling software and incorporated NAM rainfall-runoff modelling package.

The modelling was completed in four phases, with each phase reviewed by both WRC and an external consultant (Tonkin and Taylor). The four phases include:

1. update and recalibration of the NAM rainfall-runoff model,
2. update to the hydraulic MIKE 11 model,
3. calibration of the hydraulic model and
4. design simulations.

The review of the hydraulic modelling ensured a robust model output for the performance assessment.

Four rainfall events (1%, 2%, 5%, 10% AEP) have been considered for simulating design scenarios, including future sea-level rise due to climate change. An additional scenario of a constant 350m³/s flow at Ngāruawāhia was undertaken to assess the influence of the Tongariro Diversion into Lake Taupo, which will be assessed later.

Details of the model setup, calibration and execution scenarios are provided in DHI final Report (refer to doc#[21996669](#)).

Peak discharges obtained for the design standard at critical locations in the catchment are presented in the final hydraulic report.

4.1 Current Climate Result

The flood level profiles along the Lower Waikato River for a range of ARI events are shown in Appendix 3 of this report. These water levels are used as current design flood levels (DFL) to define the stopbank and spillway asset levels of service for the Lower Waikato River main channel flood protection scheme.

4.2 Future Climate Result

A comparison of modelled water levels between current 10-year and 100-year ARI and climate change RCP 6.0 and RCP 8.5 scenarios to 2101-2120 is shown in Table 4 below.:

Table 4: Comparison of water level increase at Lower Waikato River main channel for 10-year and 100-year ARI

Scenario	Average water level increase (m)
10year ARI RCP 6.0	0.28
10year ARI RCP 8.5	0.49
100year ARI RCP 6.0	0.25
100year ARI RCP 8.5	0.44

Based on the two RCP scenarios, the lower Waikato River could see up to 0.49 m (10-year ARI) and 0.44 m (100-year ARI) rise with projected climate change (RCP 6.0 and RCP 8.5 scenarios to 2101-2120).

The Lower Waikato River main channel Scheme minimum freeboard of 0.3 is less than this maximum average water level rises due to climate change.

To accommodate climate change and retain the current LOS with appropriate freeboard, the DCL's will need to increase. However, raising stopbank heights may not be economically viable in some areas.

5 Asset Performance

Flood protection schemes managed by WRC are reviewed generally every ten years as provided for in the Regional Asset Management Plan (Doc# [12705650](#)). The stopbanks performance is a measure of the vulnerability of the stopbank to withstand a design flood without overtopping.

5.1 Performance measurement

Stopbanks, spillways and dams are graded on a one to five scale to enable measurement of performance against target. The five performance grades for both stopbanks and dams are set out in Table 5, while the performance grade for spillway is set out in Table 6. The RAMP states that service levels will be achieved by maintaining stopbanks to achieve performance grade 4 or better.

5.2 Stopbank performance

The performance of Stopbanks is assessed by comparing the current actual (surveyed) crest level against the design crest level (DCL). The assessment is done at every 100m length or link of stopbank, where the current crest level is compared to DCL.

Plots showing design flood levels, design crest levels and actual crest levels for each compartment are shown in Figure 17 - Figure 75. The current performance of Stopbanks and Spillways in the Lower Waikato River Catchment have all been assessed in this scheme review.

Table 5: Stopbank performance grades

Performance grade	Stopbanks
	$P = (\text{actual freeboard}/\text{design freeboard}) \times 100$
1	$P \geq 100\%$
2	$100\% > P \geq 50\%$
3	$50\% > P \geq 25\%$
4	$25\% > P \geq 0\%$
5	$P < 0\%$

Designed Crest Level (DCL) = Design Flood Level (DFL) + Design freeboard.

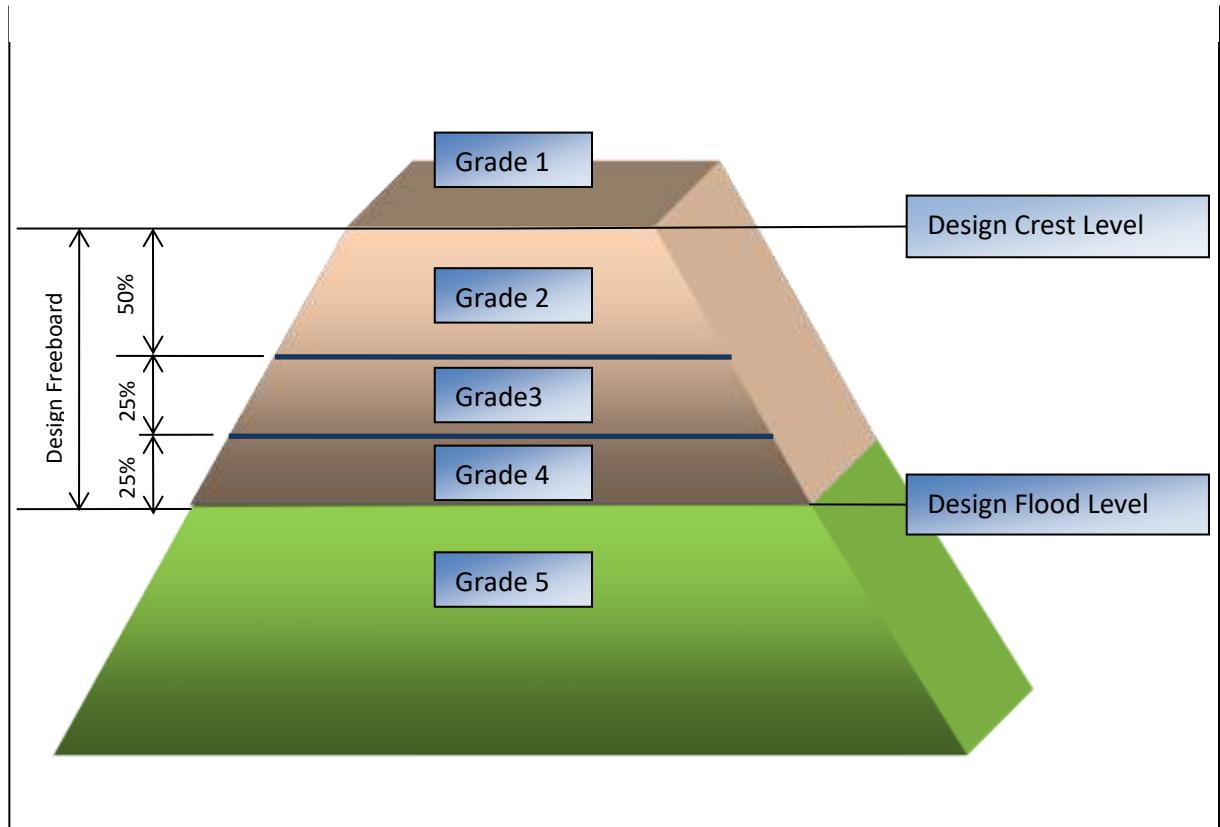

Actual freeboard = Actual Crest Level (ACL) - Design Flood Level (DFL)

Target = DFL + $\frac{1}{2}$ Freeboard (i.e., performance grade 1 or 2).

In general, the target stopbank performance grade is 1 and 2, while grades 3, 4 and 5 do not meet the required stopbank performance grade. Stopbanks with performance grade 3 do provide marginal protection and are in the monitoring phase. Although stopbank with performance grade 4 does offer some level of protection, they do tend to performance grade 5 over time due to compaction and consolidation. Hence, stopbanks that have performance Grades 4 and/or 5 are programmed for renewal and will be renewed within 5 years of being

identified. This strategy to renew stopbank with performance grades 4 and 5 was adopted in 2015 as stated in the RAMP (refer to p.117 of the RAMP- doc# [12705650](#)).

Figure 3: The performance grading scale for stopbanks is shown diagrammatically

Current performance has been assessed against the design performance standard based on the most recent stopbank crest level survey data.

The current height of all the stopbanks in the Lower Waikato River Catchment is surveyed at 100 m intervals. The performance of all stopbanks at the current Level of Service, and using the updated heights provided through hydraulic modelling, was calculated and shown graphically in Figure 4 and Figure 5.

For some stopbank/spillway sections, the performance assessment at the start and end may differ from what is onsite (due to projected coordinate survey errors). The coordinates of the first and last link of a stopbank or spillway section should be verified onsite before any asset upgrade is carried out.

Figure 4: Stopbank performance broken down by compartment

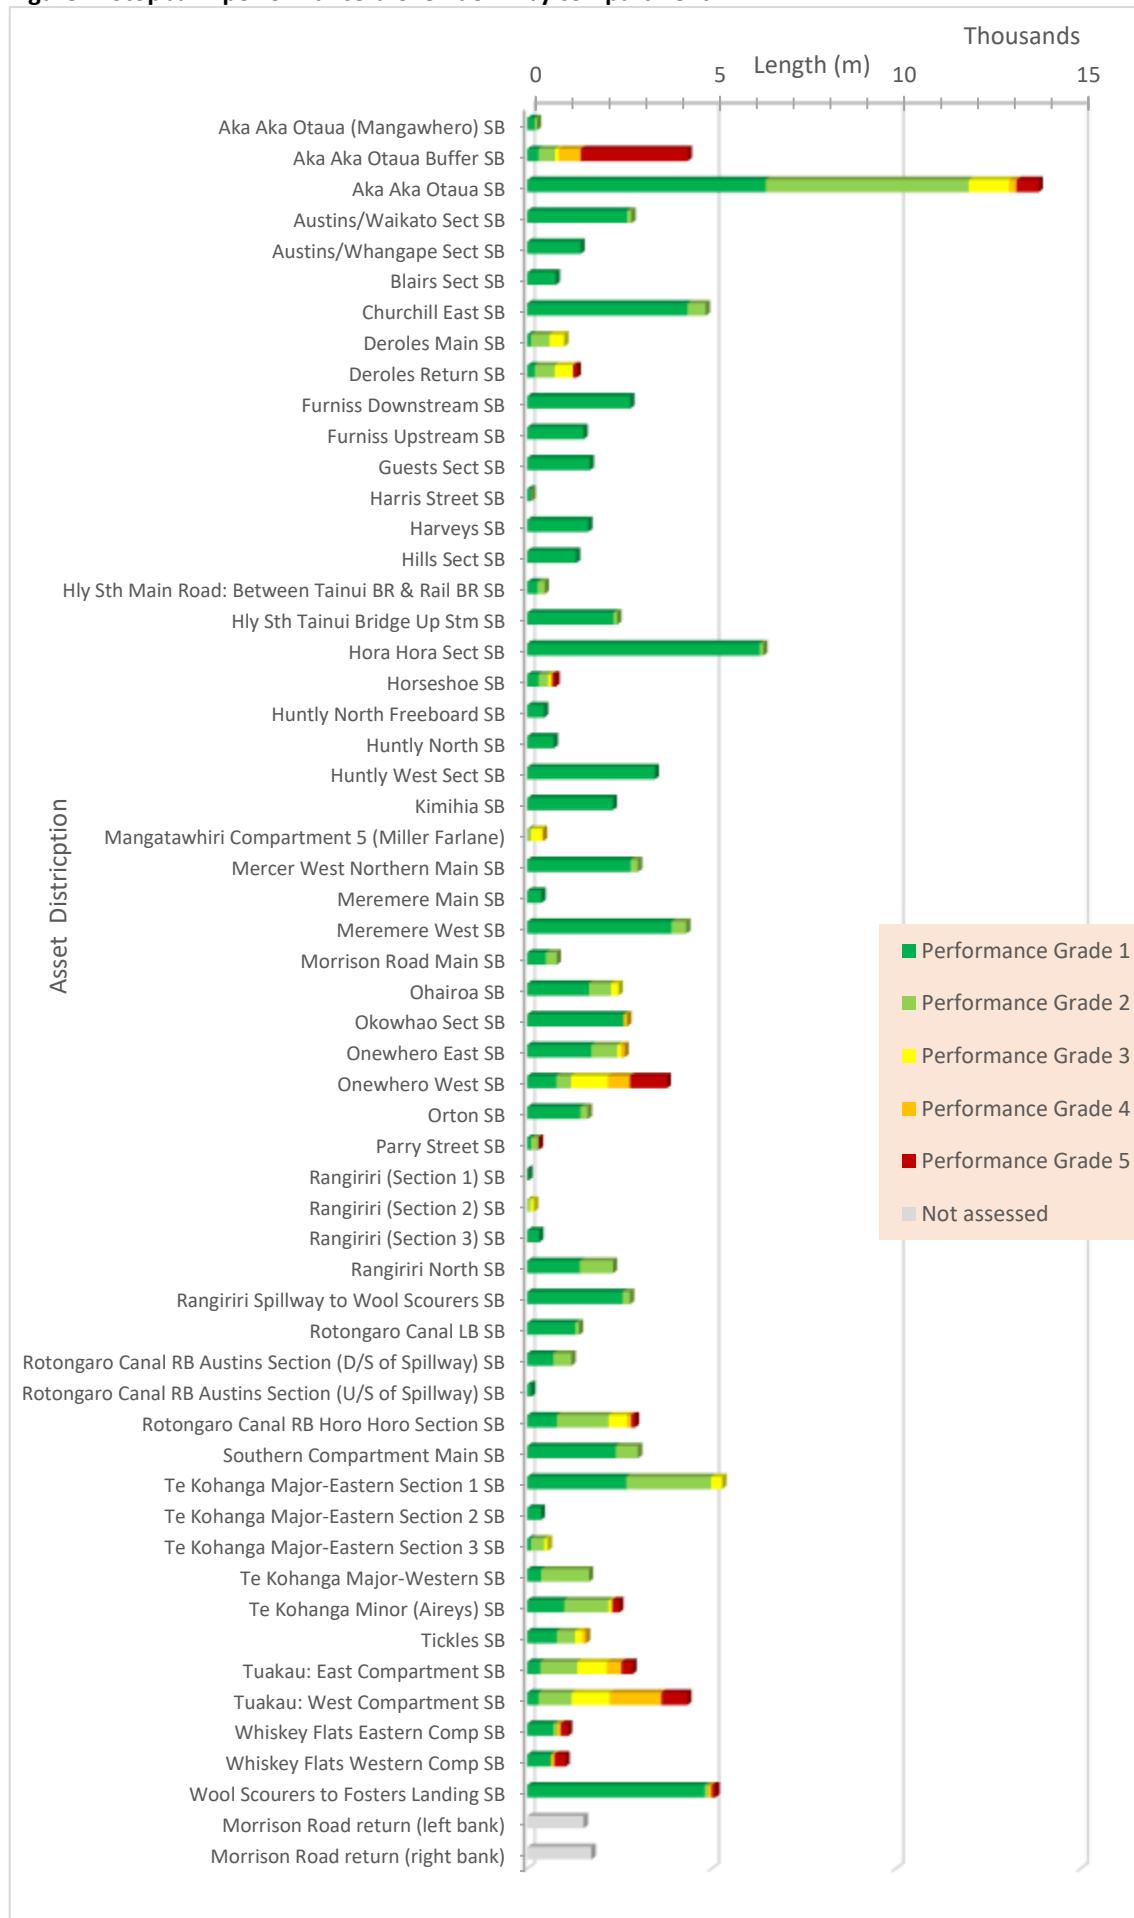

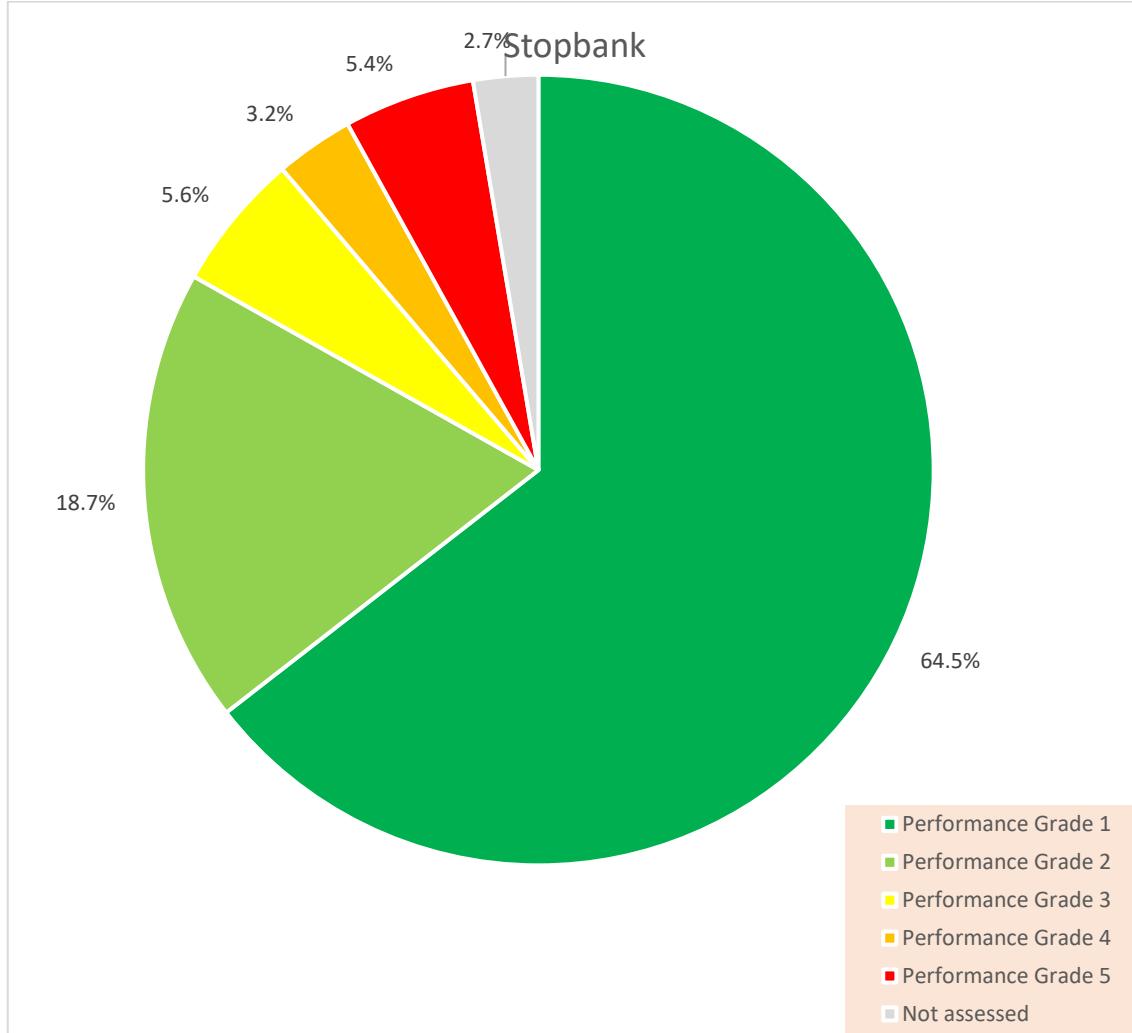

Figure 5: Overall stopbank performance

5.3 Spillway performance

The performance of spillways is assessed by comparing the current actual (surveyed) crest level against the design crest level (DCL). The design crest levels of spillways are set to overtop and do not incorporate a freeboard. Therefore, a small increase or decrease in actual crest levels can have significant implications downstream.

A performance grading system has been adopted by the Waikato Regional Council Asset Management Plan ([Doc#12705650](#)). This grading system was developed to refine the grading of spillways and to improve asset management practices in relation to spillways, as outlined in Table 6 below. Spillway activation and spillway capacity are the two indexes used in this grading system.

The performance is defined in terms of the freeboard variance for Spillway activation and the Average Ratio (R) of AFB / DFB for spillway capacity. Where AFB is Actual Freeboard and DFB is Design Freeboard:

Table 6: Performance grades – spillway activation and capacity

Performance grade	Activation criteria	Capacity criteria
	Variance (A) = Min (AFB – DFB)	Ratio (R) = Average (AFB / DFB)
1	$A \geq -0.050m$	$R \geq 1$
2	$-0.050m > A \geq -0.100m$	$0.9 \leq R < 1$
3	$-0.100m > A \geq -0.150m$	$0.5 \leq R < 0.9$
4	$-0.150m > A \geq -0.200m$	$0.25 \leq R < 0.5$
5	$A < -0.200m$	$R < 0.25$

Based on the above criteria, the spillway performance was evaluated and shown in Figure 5.4. Noting that Morrison Road Spillway was not assessed.

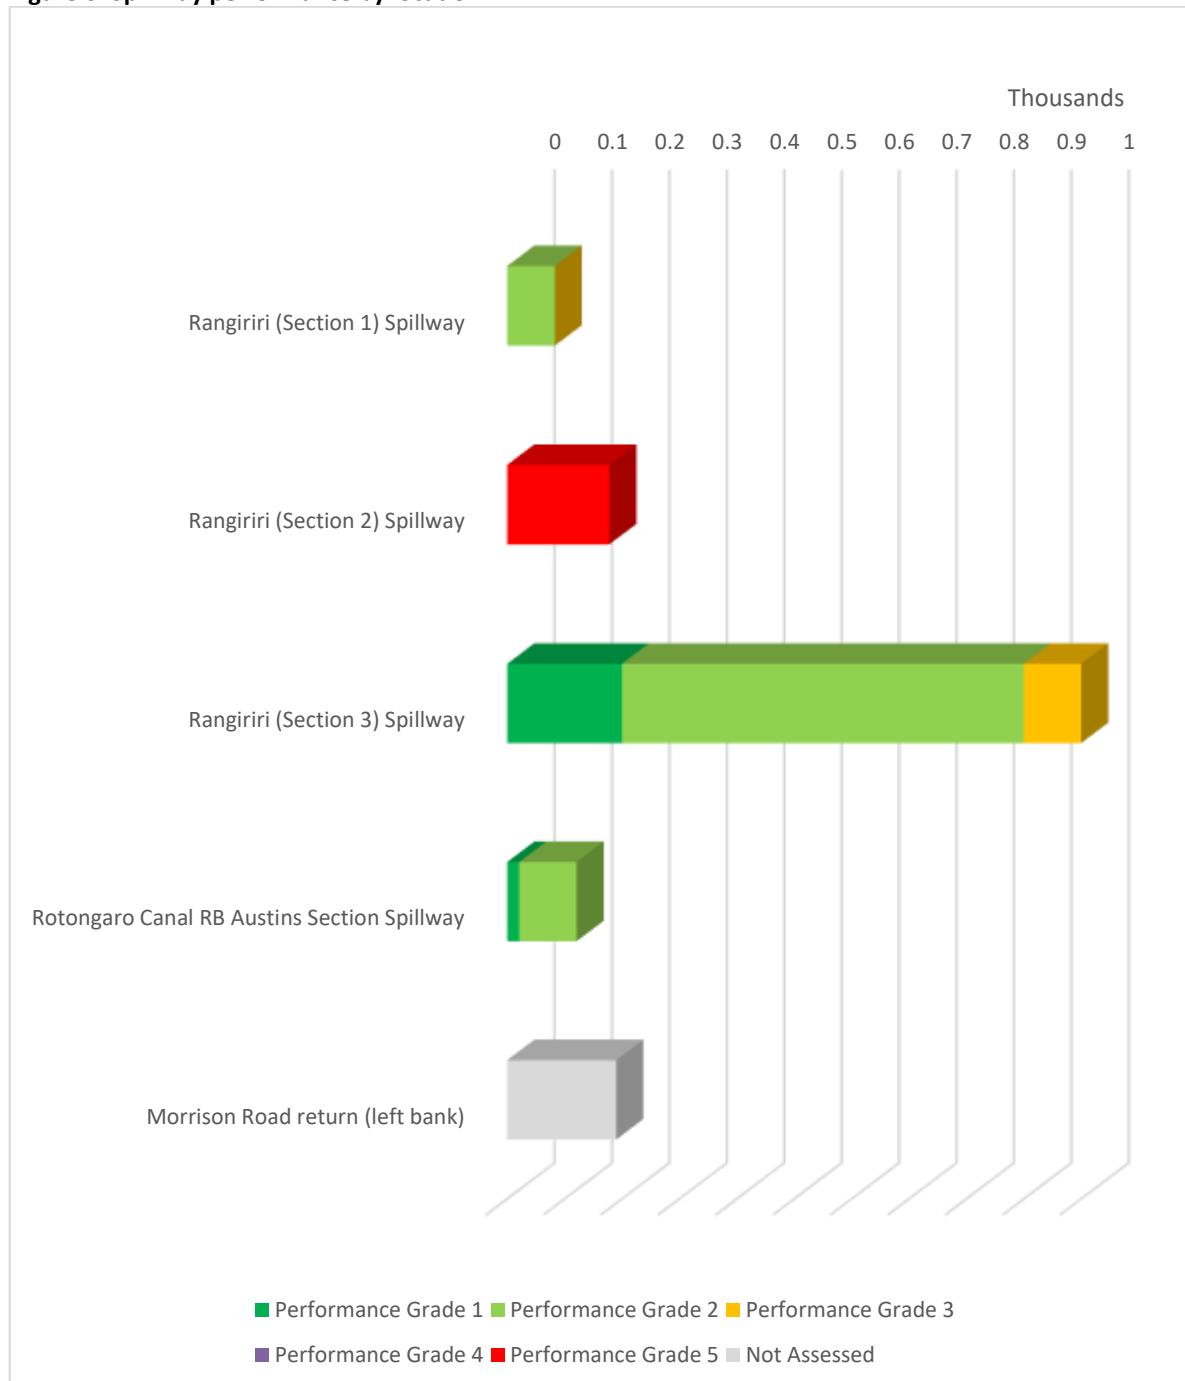

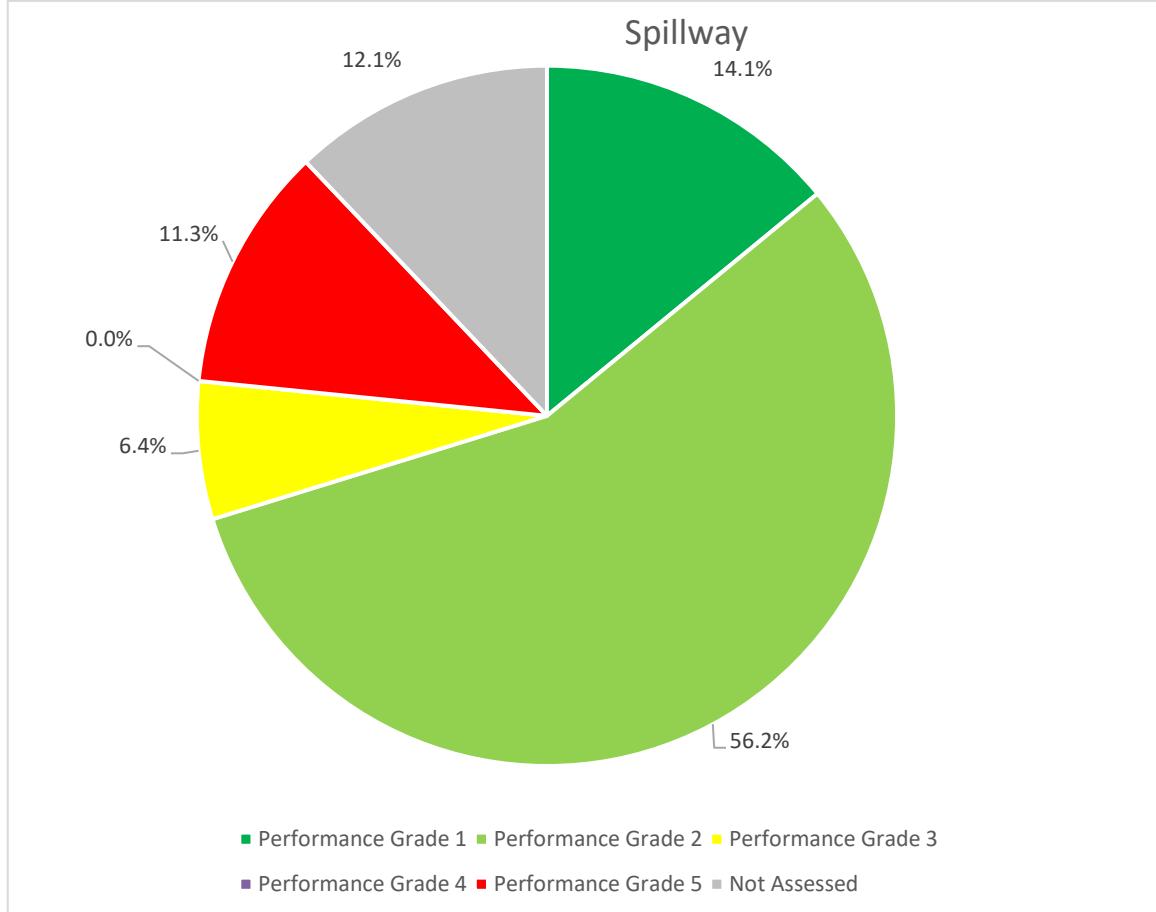

Figure 6: Spillway performance by location

Figure 7: Overall spillway performance

A map showing a comparison of the current year and previous year stopbank performance assessment is shown in appendix 2 of this report. The difference between the current and previous performance assessments are minor in most locations.

6 Conclusion

The review indicates that approximately 92.0% of scheme stopbanks (by length) are above the adopted design flood level (i.e., performance grades 1,2, 3 and 4).

Under the present climate scenario, 102,401m (83.1%) of stopbanks length meet the current performance requirements (performance grades 1 and 2). 10,882m (8.8%) provide marginal protection (grades 3 and 4). 6,609m (5.4%) are below design flood level (performance grade 5).

Also, 3,268 m (2.7%) of the total stopbanks length, the Morrison Road Return Stopbank, was not assessed.

Based on the two RCP scenarios (RCP 6.0 and RCP 8.5), the lower Waikato River could see up to 0.49 m (10-year ARI) and 0.44 m (100-year ARI) rise with projected climate change (RCP 6.0 and RCP 8.5 scenarios to 2101-2120).

The Lower Waikato River main channel Scheme minimum freeboard of 0.3 is less than this maximum average water level rises due to climate change.

To accommodate climate change and retain the current LOS with appropriate freeboard, the DCL's will need to increase. However, raising stopbank heights may not be viable in some areas.

7 Recommendations

The following items are recommended following the performance assessment of the Lower Waikato Main Channel flood protection assets:

1. The identified design flood levels and crest levels for each major stopbank and spillway are adopted.
2. The design standard is formalised as follows:
 - a. For the 123.2km of stopbanks designed to withstand river flooding, it is recommended that the existing 2, 10 and 100-year ARI design standards be retained.
3. Rangiriri Spillway performance be reassessed with the performance assessment of the Whangamarino system scheduled to start in the 21/22 financial year.
4. Based on the climate change impact information provided for the Lower Waikato River main channel, much of the existing stopbanks and spillways will require future upgrades to maintain the current Level of Service.
5. Further works are required on the accuracy of surveyed information and asset location.

8 Next Steps

A review of the overall performance and management options for Morrison Rd return stopbanks should be completed.

Initiate the assessment of whether the Aka Aka Otau Buffer Stopbank is needed, and the design crest level should be for successful operation.

For some stopbank/spillway sections, the performance assessment at the start and end may differ from what is onsite. The coordinates of the first and last link of a stopbank or spillway section should be verified onsite before any asset upgrade is carried out.

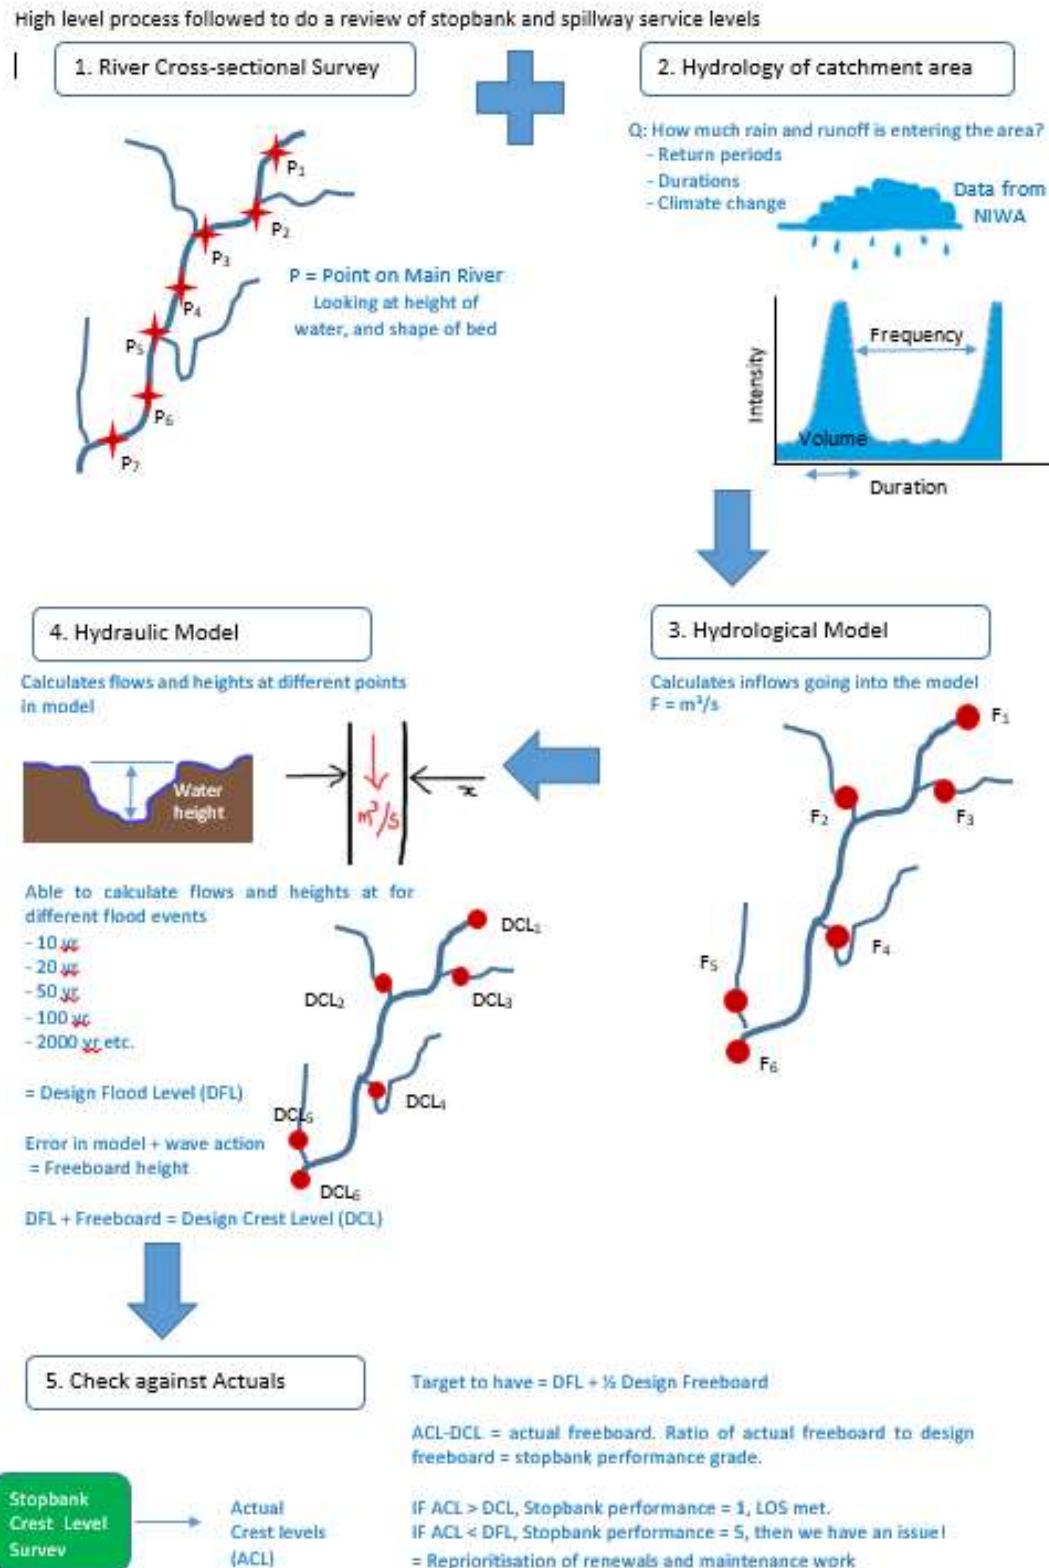

Stopbank upgrades for 10.6 km that are at a performance grade of 4 or 5 be added into the upgrade capital works programme.
