# **Abstract**

The National Policy Statement for Freshwater Management 2020 (NPS-FM 2020) requires regional councils to set baseline states for attributes as set out in the National Objectives Framework (NOF). Data from Waikato Regional Council's state-of-the-environment (SoE) river monitoring programmes was used to calculate baseline river water quality state on 7 September 2017. A five-year window ending 7<sup>th</sup> September 2017 was used, except where explicitly expressed in the NPS-FM 2020. Baseline state was calculated for six attributes: suspended fine sediment (visual clarity), ammonia toxicity (ammoniacal nitrogen), nitrate toxicity, dissolved reactive phosphorus (DRP), dissolved inorganic nitrogen (DIN) and the faecal bacterium *Escherichia coli* (*E. coli*). Noting the NOF banding values for DIN are from the draft 2019 NPSFM.

# 1 Introduction

The purpose of this report is to assess the state of river water quality in the Waikato region on 7 September 2017. This assessment is carried out under the National Objective Framework (NOF) and is for relevant attributes for compulsory values under the National Policy Statement for Freshwater Management (NPS-FM) 2020. The river state is based on the Council's River monitoring sites with at least five years of data within a period that ends no earlier than 7 September 2017. Trends are evaluated in a separate report (in prep.).

The National Policy Statement for Freshwater 2020 (Ministry for the Environment, 2020) provides local authorities with updated direction on how they should manage freshwater under the Resource Management Act 1991 (New Zealand Government, 1991). The NPS-FM 2020 came into force from 3 September 2020. The NPS-FM 2020 replaced the National Policy Statement for Freshwater Management 2014 (as amended in 2017).

The NPS-FM 2020 defines four compulsory values that need to be provided for in all natural freshwater bodies (excluding geothermal) and additional receiving environments as appropriate (coastal marine area):

- ecosystem health
- human health for recreation
- threatened species
- mahinga kai

The NPS-FM 2020 defines 22 relevant attributes that measure how well the values; ecosystem health, human health for recreation, threatened species, and mahinga kai are being provided for. There is a requirement to assess all the relevant attributes identified in Appendix 2A and 2B of the NPS-FM 2020. Of the 22 attributes, 10 are defined as requiring limits while the remaining 12 require actions plans.

Subpart 2 of the NPS-FM 2020 deals with the National Objectives Framework (NOF). There is a requirement for regional councils to identify attributes for each value and set baseline states for those attributes. Clause 3.10 of the NPS-FM 2020 is:

## **3.10 Identifying attributes and their baseline states, or other criteria for assessing achievement of environmental outcomes**

- 1) For each value that applies to an FMU or part of an FMU, the regional council:
  - a) must use all the relevant attributes identified in Appendix 2A and 2B for the compulsory values listed (except where specifically provided otherwise); and
  - b) may identify other attributes for any compulsory value; and
  - c) must identify, where practicable, attributes for all other applicable values; and
  - d) if attributes cannot be identified for a value, or if attributes are insufficient to assess a value, must identify alternative criteria to assess whether the environmental outcome of the value is being achieved.
- 2) Any attribute identified by a regional council under subclause (1)(b) or (c) must be specific and, where practicable, be able to be assessed in numeric terms.
- 3) Every regional council must identify the baseline state of each attribute, using the best information available at the time.
- 4) Attribute states and baseline states may be expressed in a way that accounts for natural variability

The NPS-FM 2020 defines baseline state, in relation to an attribute, to mean the best state out of the following:

- (a) the state on the date it is first identified by a regional council

- (b) the state on the date on which a regional council set a freshwater objective for the attribute under the National Policy Statement for Freshwater Management 2014 (as amended in 2017)
- (c) the state on 7 September 2017

This report uses the available data from the Council's long-term monitoring network to calculate the state on 7 September 2017. The analysis is intended to provide the state (numeric value) and NOF band (letter grade), it doesn't attempt to determine the best state (known as baseline state) of (a), (b), or (c) above. It is intended that the results can be used in a determination of baseline state as defined in the NPS-FM 2020.

Table 1 contains the 22 attributes from the NPS-FM 2020. In addition, dissolved inorganic nitrogen (DIN) has been included for information purposes. It is noted that DIN is not a default attribute, however under section 3.13 *Special provisions for attributes affected by nutrients*, to achieve a target attribute state for periphyton, or any other nutrient attribute, and any attribute affected by nutrients there is a requirement to set appropriate instream concentrations and exceedance criteria for dissolved inorganic nitrogen and dissolved reactive phosphorus. The banding values for DIN are from the draft 2019 NPSFM.

Separate reports (in prep.) contain the lakes and ecology attributes. Of the river's attributes, a number were not possible to calculate because routine monitoring is not carried out, namely dissolved oxygen and periphyton. Therefore, this report contains calculations of the available dataset and attributes.

**Table 1. Attributes under the NPS-FM 2020. Attributes included in this report are shown in bold. Note DIN is not an NPS-FM 2020 attribute.**

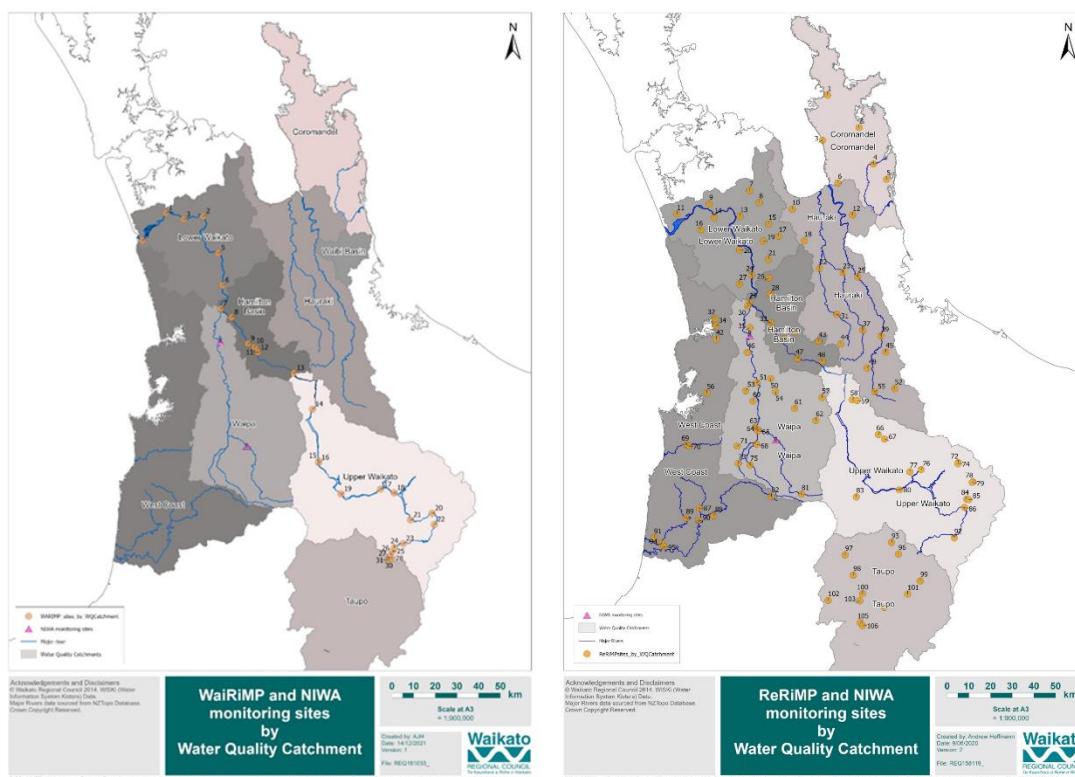

Attribute	Table number	Value	Component	Requirement	Freshwater body type	Reported
Phytoplankton (trophic state)	1	Ecosystem Health	Aquatic life	Limit	Lakes	No
Periphyton (trophic state)	2	Ecosystem Health	Aquatic life	Limit	Rivers	No
Total nitrogen (trophic state)	3	Ecosystem Health	Water quality	Limit	Lakes	No
Total phosphorus (trophic state)	4	Ecosystem Health	Water quality	Limit	Lakes	No
<b>Ammonia (toxicity)</b>	5	<b>Ecosystem Health</b>	<b>Water quality</b>	<b>Limit</b>	<b>Rivers and lakes</b>	<b>Rivers only</b>
<b>Nitrate (toxicity)</b>	6	<b>Ecosystem Health</b>	<b>Water quality</b>	<b>Limit</b>	<b>Rivers</b>	<b>Yes</b>
Dissolved oxygen	7	Ecosystem Health	Water quality	Limit	Rivers (below point sources only)	No
<b>Suspended fine sediment</b>	8	<b>Ecosystem Health</b>	<b>Water quality</b>	<b>Limit</b>	<b>Rivers</b>	<b>Yes</b>
<b><i>Escherichia coli</i> (<i>E. coli</i>)</b>	9	<b>Human contact</b>	<b>Human health</b>	<b>Limit</b>	<b>Rivers and lakes</b>	<b>Rivers only</b>
Cyanobacteria (planktonic)	10	Human contact	Human health	Limit	Lakes and lake fed rivers	No
Submerged plants (natives)	11	Ecosystem Health	Aquatic life	Action plan	Lakes	No
Submerged plants (invasive species)	12	Ecosystem Health	Aquatic life	Action plan	Lakes	No
Fish (rivers)	13	Ecosystem Health	Aquatic life	Action plan	Wadeable rivers	No
Macroinvertebrates (1 of 2)	14	Ecosystem Health	Aquatic life	Action plan	Wadeable rivers	No
Macroinvertebrates (2 of 2)	15	Ecosystem Health	Aquatic life	Action plan	Wadeable rivers	No
Deposited fine sediment	16	Ecosystem Health	Physical habitat	Action plan	Wadeable rivers	No
Dissolved oxygen	17	Ecosystem Health	Water quality	Action plan	Rivers	No
Lake-bottom dissolved oxygen	18	Ecosystem Health	Water quality	Action plan	Lakes	No

Attribute	Table number	Value	Component	Requirement	Freshwater body type	Reported
Mid-hypolimnetic dissolved oxygen	19	Ecosystem Health	Water quality	Action plan	Seasonally stratifying lakes	No
<b>Dissolved reactive phosphorus</b>	<b>20</b>	<b>Ecosystem Health</b>	<b>Water quality</b>	<b>Action plan</b>	<b>Rivers</b>	<b>Yes</b>
Ecosystem metabolism (both gross primary production and ecosystem respiration)	21	Ecosystem Health	Ecosystem processes	Action plan	Rivers	No
<i>Escherichia coli</i> ( <i>E. coli</i> ) (primary contact sites)	22	Human contact	Primary contact	Action plan	Primary contact sites in lakes and rivers (during the bathing season)	No
Dissolved inorganic nitrogen	--	Ecosystem Health	Water quality	--	Rivers	Yes

## 1.1 River monitoring sites

The Waikato Regional Council's river water quality monitoring is divided into two programmes, the 'Waikato River monitoring programme' (WaiRiMP) and the 'Regional rivers water quality monitoring programme' (ReRiMP).

Twelve locations along the Waikato River (WaiRiMP) are visited monthly (Taupo, Ohaaki, Ohakuri, Whakamaru, Waipapa, Karapiro, Hamilton-Narrows, Hamilton-Horotiu, Huntly, Rangiriri, Mercer and Tuakau) (Figure 1). For the Regional rivers programme (ReRiMP), one hundred and ten sites are sampled monthly (Figure 1). Each location is sampled at a similar time on each occasion (coefficient of variation  $\approx 2\text{--}6\%$ ) to minimise the effect of diurnal variation on the measurement of water quality parameters. Information on the sample collection, locations and water quality parameters measured in the WaiRiMP and ReRiMP monitoring programmes can be found in: [Waikato River Water Quality Monitoring Programme - Data Report 2020 | Waikato Regional Council](#) and [Regional rivers water quality monitoring programme data report 2020 | Waikato Regional Council](#). However, it is noted here that the analytes analysed in this report are collected using the same field and laboratory methodologies across the two programmes and therefore the two datasets can be combined for analysis.

**Figure 1. Waikato River water quality monitoring locations (WaiRiMP) and Regional Rivers monitoring locations (ReRiMP). Other locations form part of NIWA's National Rivers Water Quality Network, with data available from [www.niwa.co.nz](http://www.niwa.co.nz).**

In addition, data from the NIWA National River Water Quality Network (NRWQN) was sourced to provide statistics at those locations.

## 2 Methods

Monthly samples from the two monitoring programmes (WaiRiMP and ReRiMP) were collated for baseline state computation. Sampled values that were less than detection limit (see Appendix A) were halved in-line with previous council water quality reports.

To calculate the baseline state for 7 September 2017, a five-year window ending 7<sup>th</sup> September 2017 was used, except where explicitly expressed in the NPS-FM 2020, for example, the *E. coli* attribute states “Attribute state should be determined by using a minimum of 60 samples over a maximum of 5 years, collected on a regular basis regardless of weather and flow conditions. However, where a sample has been missed due to adverse weather or error, attribute state may be determined using samples over a longer timeframe.” For this attribute, the window was extended backwards in time until 60 samples were available for analysis, but the window size was not allowed to exceed 6 years. Appendix A contains the analysis timeframe for each parameter and station.

The NPS-FM 2020 states that concentrations of ammonia (as ammoniacal-nitrogen) are to be assessed for compliance “... after pH adjustment”. The rationale and method for doing this was outlined in the Ministry for the Environment’s *Guide to Attributes in Appendix 2 of the National Policy Statement for Freshwater Management* (NPSFM) that was published in 2018. Values of pH from the sampling were used to adjust the ammonia values. The most extreme pH values in the guidance documents are a low of 6.0 and a high of 9.0, however a very small number of samples exist in the council’s database that are outside this range, in these cases the pH was adjusted to 6.0 and 9.0 as appropriate. The geothermally influenced site Waiotapu Stm at Campbell Rd Br was excluded from analysis due to the high number (57 of 59) of pH values outside the range 6–9. There are 5 other sites where the pH value was adjusted as described above, in three cases only a single sample was involved, and the two remaining cases, two and three samples were adjusted. Analysis of state and band were rerun excluding these values and there were no band changes and no changes to maximum numeric values. At only one site (Mangakotukutuku Stm (Rukuhia) at Peacockes Rd) was there a change in the median value from 0.075 to 0.074 mg NH<sub>4</sub>-N/L.

Where required (for example, nitrate and *E. coli* both have numeric attribute states that require 95<sup>th</sup> percentiles) percentiles were calculated using the “Hazen” method of calculation.

Over time changes have been made to the long-term water quality monitoring locations. Reasons for changes include health and safety requirements, and access issues. In these cases, a new site is selected, and a period of concurrent sampling is carried out, if possible. These site records were then merged into a single site for analysis with concurrent samples removed. Results of comparison analysis did not indicate a change in the record due to these monitoring locations changes.

The attribute for suspended fine sediment has an attribute unit of visual clarity which is measured in the field by black disk. Consequently, fewer sites are available for banding compared to chemical analysis due to the requirement of a site being suitable to measure visual clarity. That is, the site may prohibit the physical measurement of visual clarity due to depth.

## 3 Results

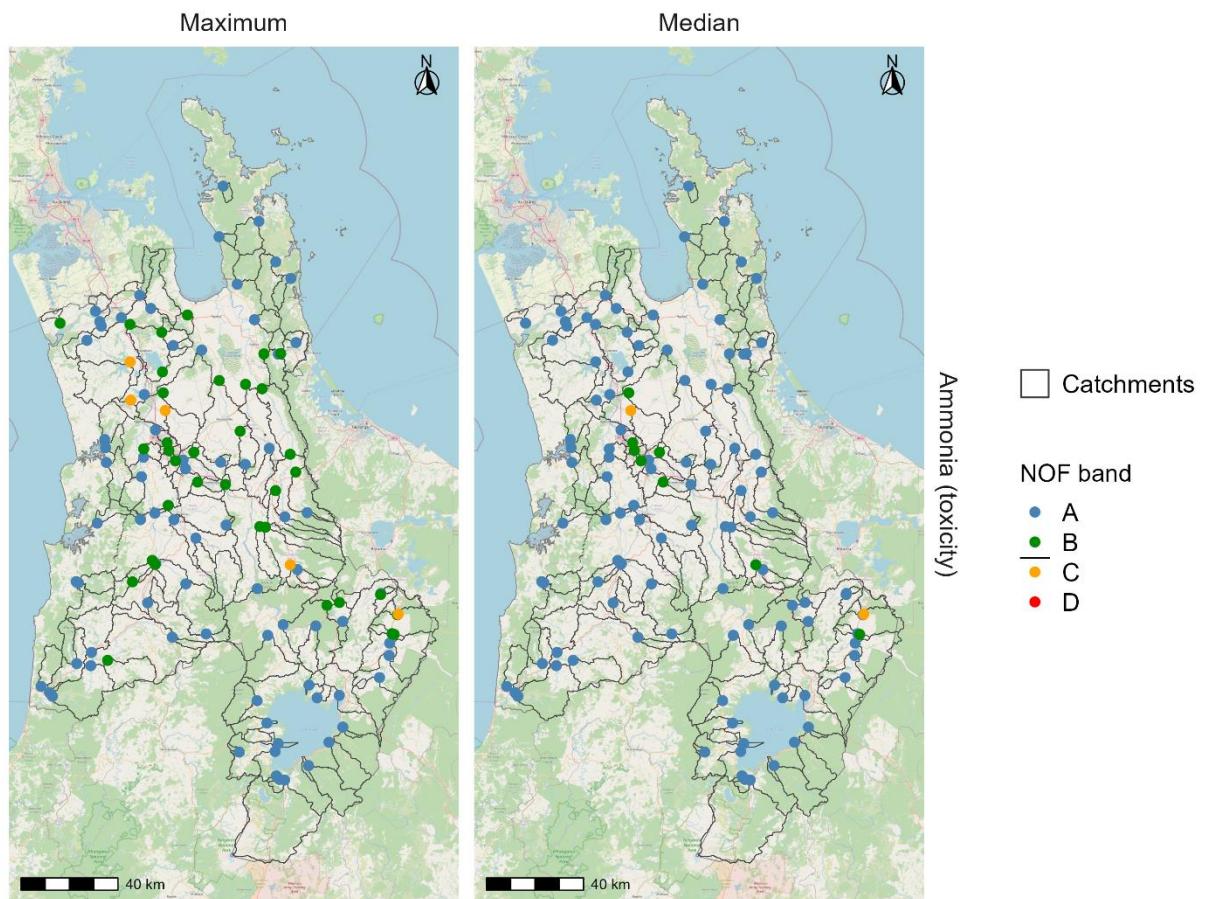

Data for the six-year or five-year period from 8<sup>th</sup> September 2011 or 8<sup>th</sup> September 2012 to 7<sup>th</sup> September 2017 was assessed against the attribute metrics in the National Objectives Framework in the NPS-FM (2020) (see Table 2). The overall band grades for the catchment of each site are mapped in Figures 2 – 6. Bands for the individual metrics per site and attribute are also reported in table form in Table A 1. The assessment period, number of samples assessed,

and number of samples with values less than the method detection limit are reported in Table A 2. The National bottom line refers to the minimum state for each attribute, indicating there are high concentrations of contaminants, and risks of adverse effects on the health of our waterways. Where a National bottom line exists, the grades that are below the bottom line are outlined with a black box on the figure key to indicate grades that don't meet the requirement.

The number and proportional of sites per NOF band by attribute and statistic are summarised in Table 2. While Table 3 contains the number and proportion of sites per NOF band for each attribute, where the NOF band is based on the worst grade from each statistic per attribute.

### 3.1 Ammonia (toxicity)

The ammonia toxicity attribute has numeric attribute states for annual median and annual maximum values as shown by the NOF bands related to ecosystem health (Figure 2).

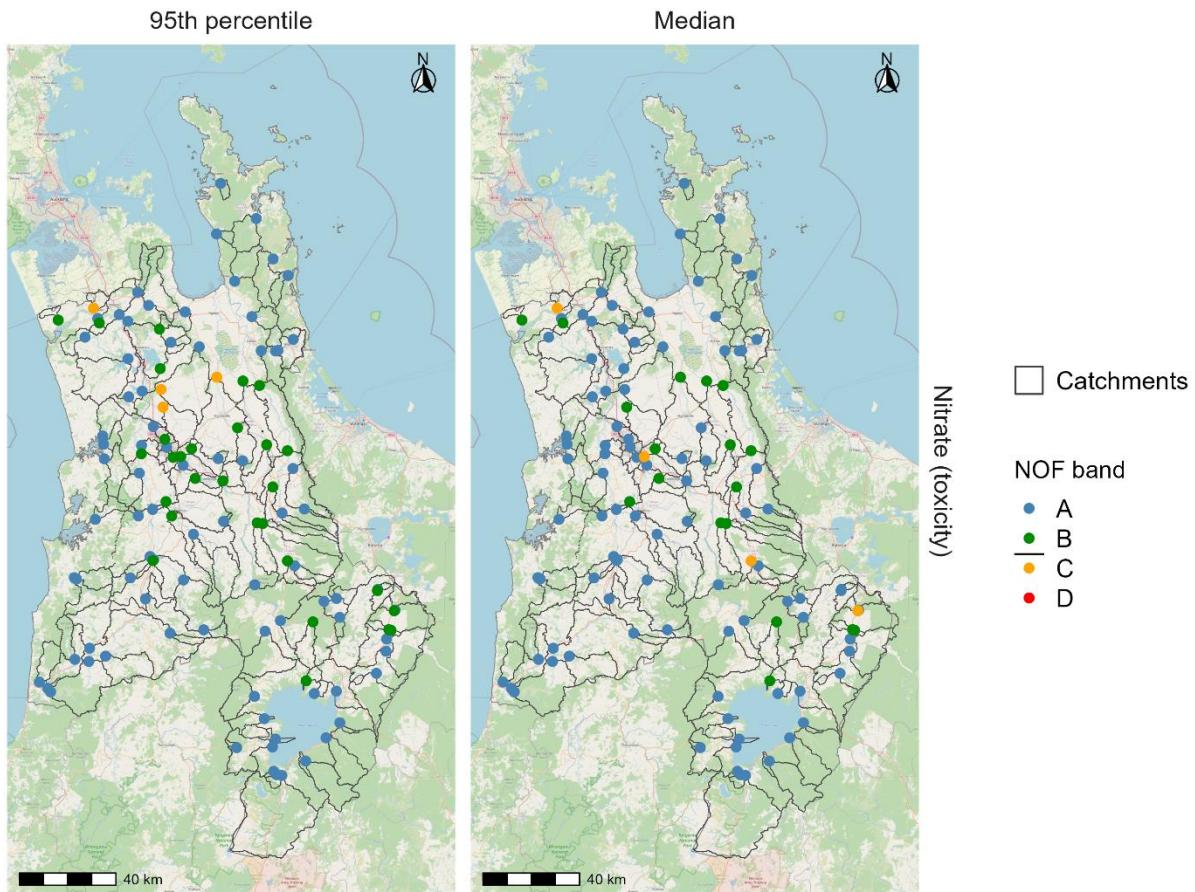

**Figure 2. River maximum and median ammoniacal-N NPS-FM (2020) NOF banding (baseline state to 2017). National bottom line for attribute shown as black line on legend.**

- The majority (91.3 %) of sites (Table 2) had a median concentration of ammoniacal-N at the 99% species protection level, where there is no observed toxicity effect on any species tested (NOF band A).
- 7.0% of sites had a median concentration of ammonia that could occasionally affect the growth or health of the 5 percent most sensitive species, based on comparison to the toxicity thresholds of NOF band B.
- 1.7% of sites exceeded the NOF bottom line for ammonia toxicity and had a median concentration of ammonia that could regularly affect the growth or health of the 20 percent most sensitive aquatic species (NOF band C) as a direct result of toxicity.
- When considering the annual maximum ammonia concentrations, most sites were in NOF band A and B (65.2% and 30.4% respectively), with a slightly greater percentage (4.3%) exceeding the National bottom line in comparison with the median attribute state (where 1.7% of sites exceeded). Overall, 4.3% of sites exceeded the National Bottom line for Ammonia (Toxicity) for either statistic.

## 3.2 Nitrate (toxicity)

The nitrate attribute has four numeric attribute states (bands A – D) for 95<sup>th</sup> percentile values and annual median values (Figure 3). The B/C band boundaries correspond to national bottom-lines for the annual median (2.4 mg/l) and annual 95th percentile (3.5 mg/l).

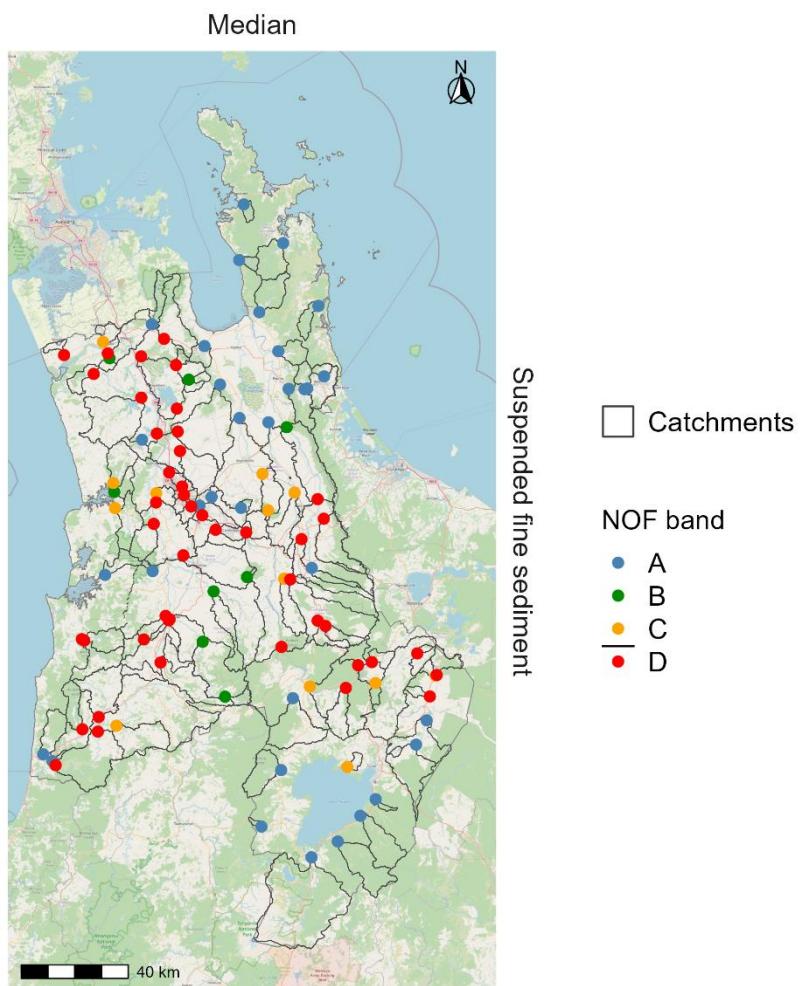

**Figure 3. River 95<sup>th</sup> percentile and median nitrate NPS-FM (2020) NOF banding (baseline state to 2017). National bottom line for attribute shown as black line on legend**

- A high percentage of the monitored sites were in NOF band A for nitrate toxicity (71.3% sites in the 95<sup>th</sup> percentile attribute state; 80.9% in the median attribute state)
- 15.7% of sites had a median concentration of nitrate that could occasionally affect the growth or health of the 5 percent most sensitive aquatic species, based on comparison to the toxicity thresholds of NOF band B. In comparison the 95<sup>th</sup> percentile attribute state had 25.2% of sites in band B.
- Less than 4 percent of sites (3.5%) exceeded the median and (3.5%) the 95<sup>th</sup> percentile NOF bottom line for nitrate (toxicity) (the point at which impacts on growth and mortality of multiple sensitive species are expected. Overall, 6.1% of sites exceed the bottom line for nitrate (toxicity) for either statistic.

### 3.3 Suspended fine sediment (visual clarity)

The NOF suspended fine sediment attribute state is based on visual clarity. The suspended fine sediment attribute has four numeric attribute states (bands A – D) (Figure 4).

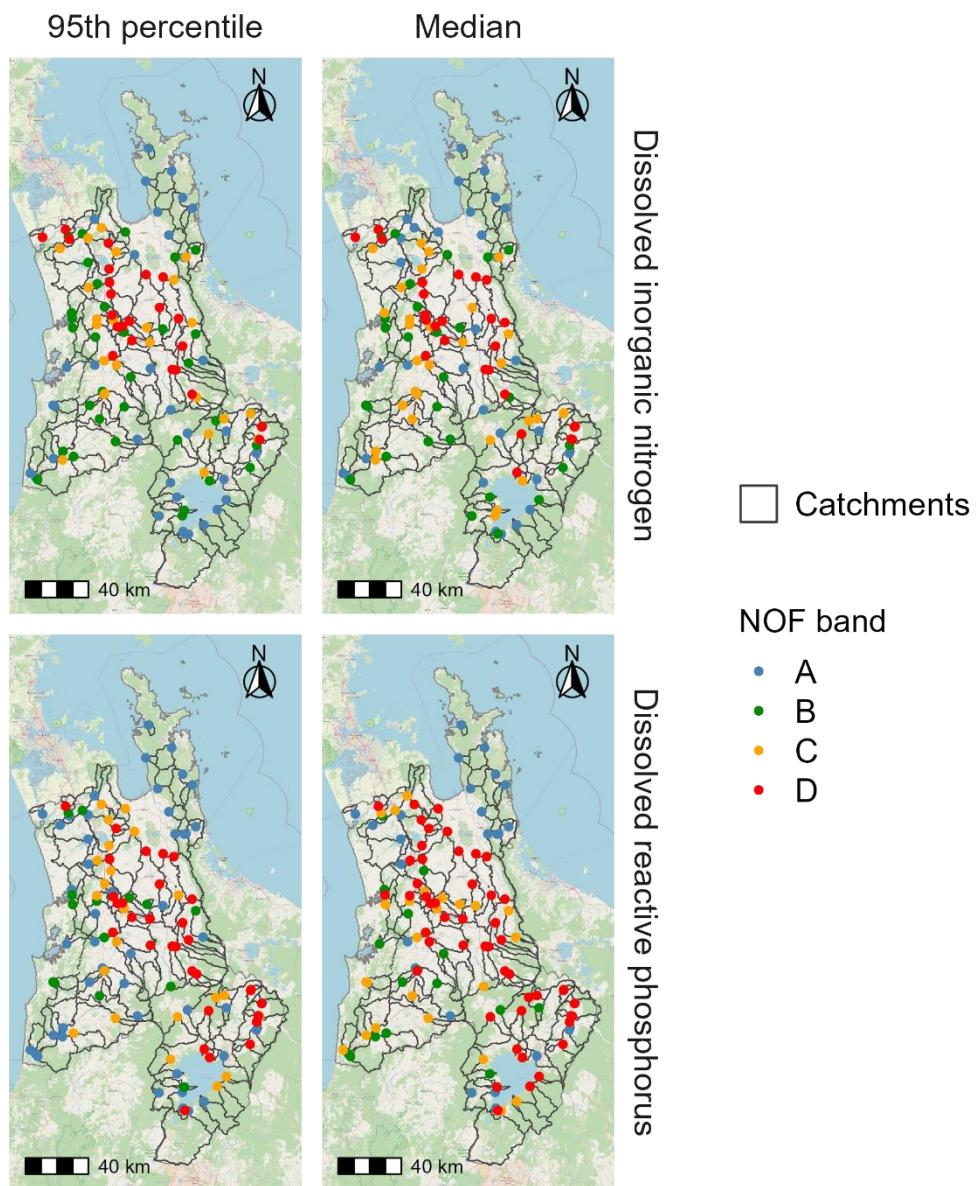

**Figure 4. Suspended fine sediment NPS-FM (2020) NOF banding (baseline state to 2017). National bottom line for attribute shown as black line on legend**

- 45.5% of sites were below the National bottom line for suspended fine sediment (band D), where there is a high impact of suspended sediment on instream biota. 13.1% of sites were in band C where there are moderate to high impacts of suspended sediment on instream biota. 41.4% of sites were classified into bands A and B where there is minimal to moderate impact of suspended sediment on biota.

### 3.4 Dissolved inorganic nitrogen and dissolved reactive phosphorus

Proposed changes to the NPS-FM released for consultation in 2019 included an attribute for dissolved inorganic nitrogen (DIN) to protect Ecosystem Health which is included in this report (Figure 5), alongside the banding for dissolved reactive phosphorus. The DIN and DRP attributes have four numeric attribute states (bands A – D) for annual maximum (95<sup>th</sup> percentile values) and annual median values.

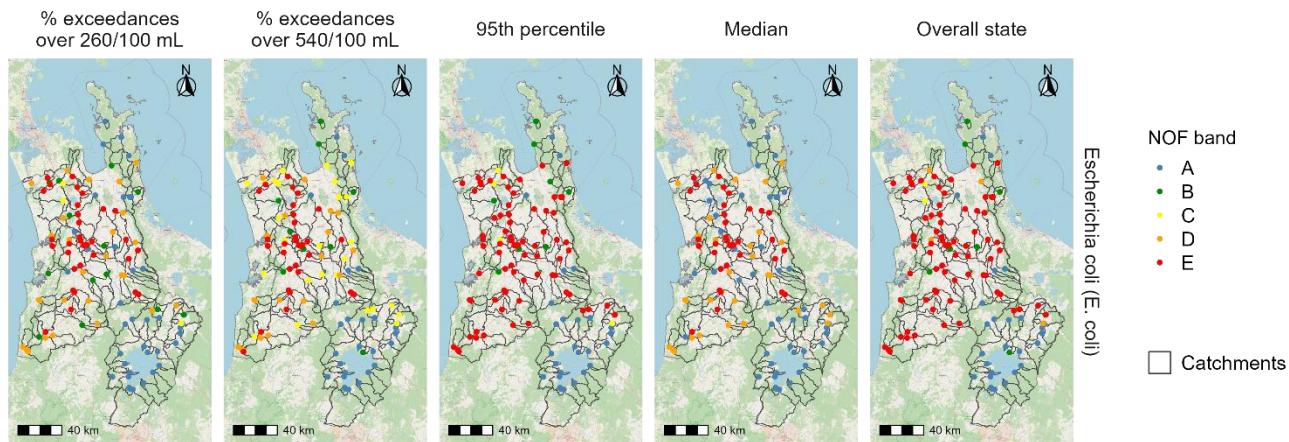

**Figure 5. Dissolved inorganic nitrogen (top) and dissolved reactive phosphorus (bottom) NPS-FM (draft 2019 and 2020) NOF banding (baseline state to 2017).**

- Noting the NOF banding values for dissolved inorganic nitrogen are sourced from the draft 2019 NPS-FM, which has been superseded by (omitted from) the 2020 version. In the draft version, the proposed national bottom line for dissolved inorganic nitrogen was 1.0 mg/L (median). 22.6% of sites exceeded the median and 20.9% exceeded the 95<sup>th</sup> percentile NOF bottom line (2.05 mg/L) for dissolved inorganic nitrogen, where ecological communities could be impacted by substantial DIN elevation above natural reference conditions. Overall, 26.1% of sites exceeded the bottom line for either dissolved inorganic nitrogen statistic.
- Attribute banding for dissolved reactive phosphorus showed the largest percentage (41.7%) of sites were in NOF band A for the 95<sup>th</sup> percentile attribute state, where no adverse effects attributable to DRP enrichment are expected.
- When classifying the data against the DRP median attribute state, only 21.7% of sites were in band A, with the largest percentage (43.5%) of sites in NOF band D. In band D ecological communities are impacted by substantial DRP elevations. Overall, 43.5% of sites were band D for DRP for either statistic.

### 3.5 *Escherichia coli*

The NOF bands for *E. coli* include four statistics: the percentage of sample exceeding 260 cfu/100 ml and 540 cfu/100 ml, 95<sup>th</sup> percentile and median. National bottom lines are not set for *E. coli* bacteria, instead the NZ Government has set targets of having >90% of specified rivers and lakes suitable for swimming by 2040 (Clean Waters 2017, NPS-FM 2017). The ‘overall state’ for *E. coli* was determined by selecting the ‘worst’ numeric attribute state in each of the four categories (Figure 6). The assessment is year-round, under all flow conditions and at all sites regardless of bathing site status in keeping with NOF guidance that human health applies to all natural freshwater bodies.

**Figure 6. *Escherichia coli* NPS-FM (2020) NOF banding (baseline state to 2017).**

- When assessing the ‘overall state’, the highest percentage of sites (63.5%) had an overall state in NOF band E, where the predicted average infection risk is >7%. Whereas in contrast, the second highest percentage of sites (25.5%) were in band A (where the predicted average infection risk is 1%), with the majority of these in the southern part of the region,
- Overall, 33.0% of sites were graded in band C or better. 67.0% of sites were in band D and E.

**Table 2. Attribute counts and percentages by NOF band for each attribute and statistic.**

NOF band	Ammonia (toxicity) maximum	Ammonia (toxicity) median	Nitrate (toxicity) 95 <sup>th</sup> percentile	Nitrate (toxicity) median	Suspended fine sediment median	Dissolved inorganic nitrogen 95 <sup>th</sup> percentile	Dissolved inorganic nitrogen median	Dissolved reactive phosphorus 95 <sup>th</sup> percentile	Dissolved reactive phosphorus median	<i>Escherichia coli</i> overall
A	75 (65.2%)	105 (91.3%)	82 (71.3%)	93 (80.9%)	33 (33.3%)	34 (29.6%)	31 (27.0%)	48 (41.7%)	25 (21.7%)	29 (25.2%)
B	35 (30.4%)	8 (7.0%)	29 (25.2%)	18 (15.7%)	8 (8.1%)	33 (28.7%)	28 (24.3%)	14 (12.2%)	16 (13.9%)	7 (6.1%)
C	5 (4.3%)	2 (1.7%)	4 (3.5%)	4 (3.5%)	13 (13.1%)	24 (20.9%)	30 (26.1%)	22 (19.1%)	24 (20.9%)	2 (1.7%)
D	--	--	--	--	45 (45.5%)	24 (20.9%)	26 (22.6%)	31 (27.0%)	50 (43.5%)	4 (3.5%)

**Table 3. Attribute counts and percentages by NOF band for each attribute. The lowest NOF grade for each statistic is used.**

NOF band	Ammonia (toxicity)	Nitrate (toxicity)	Suspended fine sediment	Dissolved inorganic nitrogen	Dissolved reactive phosphorus	<i>Escherichia coli</i>
A	75 (65.2%)	82 (71.3%)	33 (33.3%)	26 (22.6%)	25 (21.7%)	29 (25.2%)
B	35 (30.4%)	26 (22.6%)	8 (8.1%)	28 (24.3%)	14 (12.2%)	7 (6.1%)
C	5 (4.3%)	7 (6.1%)	13 (13.1%)	31 (27.0%)	26 (22.6%)	2 (1.7%)
D	--	--	45 (45.5%)	30 (26.1%)	50 (43.5%)	4 (3.5%)
E	--	--	--	--	--	73 (63.5%)

## Conclusions

The National Objectives Framework within the NPS-FM requires regional councils to calculate baseline water quality state, using best available information. This report specifically assesses and reports on state from the Regional Council's observations of water quality for rivers. These results will be used to determine baseline state under the NPS-FM and NOF. Water quality data from Waikato Regional Council's SoE rivers monitoring programmes and NIWA's NRWQN has been compared to the attribute states set out in the NOF to provide the state as of 7 September 2017, with the 'National Bottom Line' referring to the minimum state for each attribute that must be met or worked towards meeting over time (if current state is worse than). Note the period of analysis varies by site and attribute, with all attributes except *E.coli* having a period of five years to 7 September 2017. For *E. coli*, the period varies by site but exceeds no more than 6 years and no less than 5 years to 7 September 2017.

Monitored river state was calculated for six attributes: ammoniacal-N, nitrate, suspended fine sediment, dissolved inorganic nitrogen, dissolved reactive phosphorus and *E. coli*. The state calculations showed there is exceedance of national bottom-line numeric attribute states for nutrients, suspended fine sediment and *E. coli*. All six attributes either had sites classified below the national bottom line, or where applicable, in bands D and E.

To summarise the key findings:

- Most sites had ammoniacal-N concentrations at the 99% species protection level, where there is no observed toxicity effect on any species tested (NOF band A). However, there were sites (4.3%) that exceeded the National bottom line for ammonia toxicity.
- A small percentage of sites exceeded the median (3.5%) and 95th percentile (3.5%) NOF bottom line for nitrate (the point at which impacts on growth and mortality of multiple sensitive species are expected). Overall, 6.1% of sites exceeded the NOF bottom line for nitrate.
- The amount of suspended fine sediment is a key factor affecting water clarity. 45.5% of sites were below the National bottom line for suspended fine sediment (band D), where there is a high impact of suspended sediment on instream biota.
- Median dissolved inorganic nitrogen exceeded the national bottom line in 26.1% of sites, where ecological communities are impacted by substantial DIN elevation above natural reference conditions
- 67.0% of sites had *E. coli* concentrations in the NPS-FM Band D or E, with a predicted average infection risk >3%. The highest percentage of sites (63.5%) were in band E, with an average infection risk of >7%.
- The largest portion of sites with exceedances were for the suspended fine sediment and *E. coli* attributes.
